AI Opportunity Report - Cynbit Technologies

Ananya Garg | AI/ML Engineer Intern Assessment | 30 October 2026

1. Objective

For this assessment, I studied Cynbit's public website to understand its services, products, case studies and working process. Based on this information, I identified areas where AI/ML could potentially help the business.

Since I only have access to public information, these are possible opportunities and not assumptions about Cynbit's current internal processes.

2. AI/ML Opportunities

I shortlisted the following opportunities:

Opportunity	Idea
Discovery Copilot	Analyze a client enquiry, understand the requirement, find relevant Cynbit services and case studies, and prepare a first discovery brief.
BitElevate PR Assistant	Give students an initial automated code review before mentor review.
Website Q&A Assistant	Answer visitor questions using information from Cynbit's services, products and case studies.
Revio Reply Checker	Review AI-generated customer review replies for tone and unsupported claims.
TenantEase Payment Prediction	Use historical payment information to identify possible late payments.

To select one idea for the prototype, I compared them on evidence from the website, feasibility, possible value and risk. Scores are from 1 (low) to 5 (high).

Opportunity	Evidence	Feasibility	Value	Low Risk	Total / 20
Discovery Copilot	5	5	4	4	18
Website Q&A Assistant	4	5	2	5	16
BitElevate PR Assistant	4	2	4	3	13
Revio Reply Checker	4	3	3	3	13
TenantEase Payment Prediction	4	2	4	3	13

These scores are only my assessment for selecting a prototype.

3. Selected Opportunity - Cynbit Discovery Copilot

I selected the Discovery Copilot because it is directly related to Cynbit's public discovery process. The contact page states that the team analyzes requirements and prepares a tailored strategic overview before connecting with a prospect.

A client enquiry may initially be short or unstructured. Before responding, the requirement has to be understood and connected with the right capabilities. The prototype helps with this process by:

1. classifying the enquiry as a Business Sales Lead, Non-Sales Enquiry, or Not Applicable;
2. searching a knowledge base created from Cynbit's public services, products and case studies;
3. retrieving the most relevant information;
4. using an LLM to prepare a structured discovery brief;
5. generating discovery questions and a draft response; and
6. keeping the final decision and response with a human reviewer.

The system does not automatically contact a prospect.

4. Why I Chose This Opportunity

The information needed for this prototype was available on Cynbit's public website, so I could build and test it without requiring private company data.

The project also allowed me to combine multiple AI/ML concepts in one small system:

- text classification;
- information retrieval;
- LLM prompting;
- structured output validation;
- grounding checks; and
- human-in-the-loop AI.

The LLM is given retrieved evidence rather than being asked to generate recommendations only from its general knowledge. Additional checks are used after generation to reduce unsupported recommendations and claims.

5. Limitations and Next Steps

The prototype has been tested using manually created enquiries rather than real Cynbit enquiries. Therefore, the current evaluation shows how the system behaves on my test cases and should not be treated as general production accuracy.

If this system were taken further, I would test it on anonymized historical enquiries labelled by the Cynbit team. This would make it possible to measure classification accuracy, retrieval quality and how much employees need to edit the generated drafts.

The current knowledge base is small, so TF-IDF retrieval is sufficient for the prototype. If the knowledge base became much larger or had more varied language, I would compare the current approach with embedding-based semantic retrieval.
